How do we process wastewater?

COLLECTION

WASTEWATER ENTERS THE COLLECTION SYSTEM...

If your home is connected to a public sewer system (versus a septic tank), your wastewater line is connected to a sewer pipe. This is just the beginning of a complex collection system that can transport thousands or even millions of gallons of wastewater every day.

STEP 2: GRIT REMOVAL

Sand and grit that can damage pumps and other equipment in the treatment system are removed by allowing these heavier solids to settle.

PROCESSING

The job of the treatment plant is to remove contaminants and harmful substances from wastewater so that it can be safely returned to the environment. There are six major steps commonly used in this process.

WASTEWATER TREATMENT PLANT

All kinds of objects can be washed or flushed into sewer systems. As the wastewater enters the treatment plant, it passes through screens that remove untreatables like plastic, trash, rags and other large debris.

STEP 3: BIOLOGICAL TREATMENT

Biological treatment is one of the major unit processes used in wastewater treatment. The process uses bacteria to breakdown and remove organic wastes and grow new bacteria to sustain the process.

STEP 4: CLARIFICATION

Bacteria and other solids

liquid stream in clarifiers,

and the clear liquid flows to the next stage for further treatment. Most of

the settled bacteria are recycled to the biological treatment basin to

breakdown more incoming wastes. The remaining biosolids are removed from

STEP 6: DEWATERING

Excess solids from the

inactivate pathogens before
